[Received 25 February. Accepted 20 June 2016]

ABSTRACT. The present study deals with two dimensional deformation, due to internal heat source in a thermoelastic microelongated solid. A mechanical force is applied along the interface of elastic half space and thermoelastic microelongated half space. The problem is in the context of Green Lindsay (GL) theory. The analytic expressions for displacement component, normal force stress, temperature distribution and microelongation have been derived. The effect of internal heat source and microelongation on the derived components have been depicted graphically.

KEY WORDS: Thermoelasticity, microelongation, heat source, normal mode, elastic solid.

1. Introduction

Classical elasticity is inadequate to discuss the behaviour of materials possessing internal structure. The micropolar elastic model is more realistic than the purely elastic theory to study the response of materials to external stimuli. Eringen and Suhubi [1–2] developed a non linear theory of micro elastic...
Praveen Ailawalia, Sunil Kumar Sachdeva, Devinder Singh Pathania

solids. Later on, a theory was framed in which material particles in solids can undergo macro-deformations, as well as micro-rotations by Eringen [3–5] and named the theory as “linear theory of micropolar elasticity”.

The axial stretch was included during the rotation of molecules by Eringen [6] and named the theory as micropolar elastic solid with stretch. Nowacki [7], Eringen [8], Tauchert et al. [9], Tauchert [10] and Nowacki and Olszak [11] included thermal effects in the micropolar theory. One can refer to Dhaliwal and Singh [12] for a review on the micropolar thermoelasticity and a historical survey of the subject. The general theory of micromorphic media has been summed up in “Continuum Physics” series by Eringen and Kafadar [13]. Lord and Shulman [14] and coupled theory of elasticity are two important generalized theories of thermoelasticity. Entropy production inequality was proposed by Muller [15]. A generalization of this inequality was proposed by Green and Laws [16]. Green and Lindsay [17] obtained another version of these constitutive equations. These equations were also obtained independently and more explicitly by Suhubi [18]. This theory contains two constants that act as relaxation times and modify all the equations of coupled theory, not only the heat equations. The classical Fourier law of heat conduction is not violated, if the medium under consideration has a centre of symmetry.

A microelongated elastic solid possesses four degrees of freedom: three for translation and microelongation. In microelongation theory, the material particles can perform only volumetric micro elongation in addition to classical deformation of the medium. The material points of such medium can stretch and contract independently of their translations. Solid liquid crystals,
Internal Heat Source in Thermoelastic Microelongated Solid . . .

composite materials reinforced with chopped elastic fibres, porous media with pores filled with non-viscous fluid or gas can be categorized as microelongated medium. Shaw and Mukhopadhyay [27] discussed the variation of periodical heat source response in a functionally graded microelongated medium. Shaw and Mukhopadhyay [28] studied the thermoelastic interactions in a microelongated, isotropic, homogeneous medium in the presence of a moving heat source. Ailawalia and Sachdeva discussed plane strain problem in a thermoelastic microelongated solid with an overlying infinite non-viscous fluid [34].

In the present problem, deformation due to internal heat source in a thermoelastic microelongated solid along the interface of elastic half space has been discussed. The normal mode analysis is applied to derive the expressions for the considered variables for Green Lindsay (GL) theory of thermoelasticity and the variations of the considered variables are represented graphically.

2. Problem formulation

The constitutive equation for a homogeneous, isotropic, microelongated, thermoelastic solid are [28]:

\[
\begin{align*}
\sigma_{kl} &= \lambda \delta_{kl} u_{r,r} + \mu (u_{k,l} + u_{l,k}) - \beta_0 \left( 1 + t_1 \delta_{2k} \frac{\partial}{\partial t} \right) T \delta_{kl} + \lambda_0 \delta_{kl} \varphi, \\

m_k &= a_0 \varphi_{,k}, \\
s - \sigma &= \lambda_0 u_{k,k} - \beta_1 \left( 1 + t_1 \delta_{2k} \frac{\partial}{\partial t} \right) T + \lambda_1 \varphi, \\
q_k &= \frac{K^*}{\rho j_0} T_k, \\
\end{align*}
\]

where, \( \beta_0 = (3\lambda + 2\mu)\alpha_{t_1}, \beta_1 = (3\lambda + 2\mu)\alpha_{t_2}. \)

The field equation of motion, according to [29, 30] and heat conduction equation according to [31] for the displacement, microelongation and temperature changes are:

\[
\begin{align*}
(\lambda + \mu) u_{j,ij} + \mu u_{i,ij} - \beta_0 \left( 1 + t_1 \delta_{2k} \frac{\partial}{\partial t} \right) T_i + \lambda_0 \varphi_{,i} &= \rho \ddot{u}_i, \\
 a_0 \varphi_{,ii} + \beta_1 \left( 1 + t_1 \delta_{2k} \frac{\partial}{\partial t} \right) T - \lambda_1 \varphi - \lambda_0 u_{j,j} &= \frac{1}{2} \rho j_0 \dot{\varphi},
\end{align*}
\]
\[ K^* T_{,ii} - \rho C^* \left( 1 + t_0 \delta_{1k} \frac{\partial}{\partial t} \right) \dot{T} - \beta_0 T_0 \left( 1 + t_0 \delta_{1k} \frac{\partial}{\partial t} \right) \dot{u}_{k,k} - \beta_1 T_0 \dot{\varphi} + \rho \left( 1 + t_0 \delta_{1k} \frac{\partial}{\partial t} \right) Q = 0. \]

The equation of motion and stress components in an elastic medium are given by [32]:

\[ (\lambda^e + \mu^e) u^e_{,ij} + \mu^e u^e_{,ii} = \rho \ddot{u}^e_i, \]

\[ \sigma^e_{ij} = \lambda^e u^e_{,j,j} \delta_{ij} + \mu^e (u^e_{,i,j} + u^e_{,j,i}). \]

We consider a normal force of magnitude \( P_1 \), acting along the interface of microelongated thermoelastic solid half space, occupying the region \( 0 \leq x \leq \infty \) and an elastic solid half space in the region \( -\infty \leq x \leq 0 \), as shown in Fig. 1. We have restricted our analysis to the plane strain parallel to \( xy \) plane with displacement vector:

\[ \bar{u}_i = (u_1, u_2, 0) \quad \text{and} \quad \bar{u}^e_i = (u^e_1, u^e_2, 0). \]

To simplify calculations, we use following non-dimensional variables:

\[ x' = \frac{\omega^*}{c_1} x, \quad y' = \frac{\omega^*}{c_1} y, \quad u'_i = \frac{\omega^* \rho c_1}{\beta_0 T_0} u_i, \quad u^e'_i = \frac{\omega^* \rho c_1}{\beta_0 T_0} u^e_i, \quad t' = \omega^* t, \]

\[ t'_0 = \omega^* t_0, \quad t'_1 = \omega^* t_1, \quad \sigma'_{ij} = \frac{\sigma_{ij}}{\beta_0 T_0}, \quad \varphi' = \frac{\lambda_0}{\beta_0 T_0} \varphi, \quad \sigma^e'_{ij} = \frac{\sigma^e_{ij}}{\beta_0 T_0}, \quad P'_1 = \frac{P_1}{\beta_0 T_0}, \quad T' = \frac{T}{T_0}, \quad Q' = \frac{1}{\omega^* c_1^2} Q, \]

where, \( \omega^* = \frac{\rho c_1^2 C^*}{K^*} \), \( c_1^2 = \frac{\lambda + 2\mu}{\rho} \).
Using above non dimensional variables and (9a) in equations (5)–(7), we obtain the following non dimensional equations (after dropping superscripts):

\begin{align}
(10) & \quad l_1 \frac{\partial^2 u_1}{\partial x^2} + l_2 \frac{\partial^2 u_2}{\partial x \partial y} + l_3 \frac{\partial^2 u_1}{\partial y^2} - \left(1 + t_1 \delta_{2k} \frac{\partial}{\partial t}\right) \frac{\partial T}{\partial x} + \frac{\partial \varphi}{\partial x} = \frac{\partial^2 u_1}{\partial t^2}, \\
(11) & \quad l_3 \frac{\partial^2 u_2}{\partial x^2} + l_2 \frac{\partial^2 u_1}{\partial x \partial y} + l_1 \frac{\partial^2 u_2}{\partial y^2} - \left(1 + t_1 \delta_{2k} \frac{\partial}{\partial t}\right) \frac{\partial T}{\partial y} + \frac{\partial \varphi}{\partial y} = \frac{\partial^2 u_2}{\partial t^2}, \\
(12) & \quad \left(\frac{\partial \varphi}{\partial x^2} + \frac{\partial \varphi}{\partial y^2}\right) + l_4 \left(1 + t_1 \delta_{2k} \frac{\partial}{\partial t}\right) T - l_5 \varphi - l_6 \left(\frac{\partial u_1}{\partial x} + \frac{\partial u_2}{\partial y}\right) = l_7 \frac{\partial^2 \varphi}{\partial t^2}, \\
(13) & \quad -l_9 \left(\frac{\partial}{\partial t} + t_0 \delta_{1k} \frac{\partial^2}{\partial t^2}\right) \left(\frac{\partial u_1}{\partial x} + \frac{\partial u_2}{\partial y}\right) - l_{10} \frac{\partial \varphi}{\partial t} + l_{11} \left(1 + t_0 \delta_{1k} \frac{\partial}{\partial t}\right) Q = 0.
\end{align}

The dimensionless constitutive relations are:

\begin{align}
(14) & \quad \sigma_{xx} = l_1 \frac{\partial u_1}{\partial x} + l_{12} \frac{\partial u_2}{\partial y} - \left(1 + t_1 \delta_{2k} \frac{\partial}{\partial t}\right) T + \varphi, \\
(15) & \quad \sigma_{xy} = l_3 \left(\frac{\partial u_1}{\partial y} + \frac{\partial u_2}{\partial x}\right), \\
(16) & \quad \sigma_{yy} = l_{12} \frac{\partial u_1}{\partial x} + l_1 \frac{\partial u_2}{\partial y} - \left(1 + t_1 \delta_{2k} \frac{\partial}{\partial t}\right) T + \varphi,
\end{align}

where, the coefficients \(l_i\) are given in Appendix-1.

3. Normal mode analysis

The solution of the considered physical variables can be decomposed in terms of normal mode as:

\[(u_t, u_i^*, T, \varphi, \sigma_{ij}, \sigma_{ij}^*) (x, y, t) = (u_t^*, u_i^{**}, T^*, \varphi^*, \sigma_{ij}^*, \sigma_{ij}^{**}, Q^*) (x) e^{\omega t + i \beta y},\]

where, \(u_t^*(x), u_i^{**}(x), T^*(x), \varphi^*(x), \sigma_{ij}^*(x), \sigma_{ij}^{**}(x), Q^*\) are the amplitudes of field quantities.
Using normal mode in equation (10)–(13), we get:

\[
(l_1 D^2 - B_1)u_1^* + ibl_2 Du_2^* - B_2 DT^* + D\phi^* = 0,
\]

\[
ibl_2 Du_1^* + (l_3 D^2 - B_3)u_2^* - ibB_2 T^* + ib\phi^* = 0,
\]

\[
-l_6 Du_1^* - ibl_6 u_2^* + B_2 l_4 T^* + (D^2 - B_4)\phi^* = 0,
\]

\[
-l_9 B_6 Du_1^* - ibl_9 B_6 u_2^* + (D^2 - B_7)T^* - l_10 \omega \phi^* = -l_11 B_5 Q^*,
\]

\[
\sigma_{xx} = l_1 Du_1^* + ibl_12 u_2^* - B_2 T^* + \varphi^*,
\]

\[
\sigma_{yy} = l_12 Du_1^* + ibl_1 u_2^* - B_2 T^* + \varphi^*,
\]

\[
\sigma_{xy} = l_3 (ibu_1^* + Du_2^*),
\]

where, the coefficients \(B_j\) are given in Appendix 2.

Eliminating \(u_2^*(x)\), \(T^*(x)\), \(\phi^*(x)\) from equations (17)–(20), we get:

\[
(D^8 + AD^6 + BD^4 + CD^2 + E) u_1^*(x) = RQ^*,
\]

where, the coefficients \(A, B, C, E\) and \(R\) are given in Appendix 3.

Similarly, \(u_2^*(x), T^*(x), \phi^*(x)\) satisfies the equation:

\[
(D^8 + AD^6 + BD^4 + CD^2 + E)(u_2^*(x), T^*(x), \phi^*(x)) = RQ^*,
\]

which can be written as:

\[
(D^2 - k_1^2)(D^2 - k_2^2)(D^2 - k_3^2)(D^2 - k_4^2) u_1^*(x) = RQ^*,
\]

where \(k_n^2\), \((n = 1, 2, 3, 4)\) are the roots of characteristic equation (25).

The series solution for the physical quantities are given by:

\[
u_1^*(x) = \sum_{n=1}^{4} [M_n(b, \omega)e^{-k_nx}] + S,
\]

\[
u_2^*(x) = \sum_{n=1}^{4} [M'_n(b, \omega)e^{-k_nx}] - S_1,
\]
\begin{align}
T^*(x) &= \sum_{n=1}^{4} [M_n''(b, \omega) e^{-k_n x}] - S_2, \\
\varphi^*(x) &= \sum_{n=1}^{4} [M_n'''(b, \omega) e^{-k_n x}] - S_3,
\end{align}

where, \(M_n(b, \omega), M'_n(b, \omega), M''_n(b, \omega), M'''_n(b, \omega)\) are specific functions, depending upon \(b\) and \(\omega\).

Using equation (27)–(30) in equation (17)–(20), we get:
\begin{align}
M'_n(b, \omega) &= H_{1n} M_n(b, \omega), \\
M''_n(b, \omega) &= H_{2n} M_n(b, \omega), \\
M'''_n(b, \omega) &= H_{3n} M_n(b, \omega).
\end{align}

Using (31)–(33), the series solution takes the form:
\begin{align}
u_2^*(x) &= \sum_{n=1}^{4} [H_{1n} M_n(b, \omega) e^{-k_n x}] - S_1, \\
T^*(x) &= \sum_{n=1}^{4} [H_{2n} M_n(b, \omega) e^{-k_n x}] - S_2, \\
\varphi^*(x) &= \sum_{n=1}^{4} [H_{3n} M_n(b, \omega) e^{-k_n x}] - S_3, \\
\sigma^*_{xx}(x) &= \sum_{n=1}^{4} [H_{4n} M_n(b, \omega) e^{-k_n x}] + S_4, \\
\sigma^*_{xy}(x) &= \sum_{n=1}^{4} [H_{5n} M_n(b, \omega) e^{-k_n x}] + S_5,
\end{align}
\[
\sigma_{yy}^*(x) = \sum_{n=1}^{4} [H_{6n} M_n(b, \omega) e^{-k_n x}] + S_6,
\]

where, coefficients \( H_{ij} \), \( S \) and \( S_j \) are given in Appendix 4.

Similarly, for the elastic half space, the solutions are of the form:

\[
u_1^e(x) = \sum_{n=1}^{2} [R_n(b, \omega) e^{r_n x}],
\]

\[
u_2^e(x) = \sum_{n=1}^{2} [R'_n(b, \omega) e^{r_n x}],
\]

where \( R_n(b, \omega) \) and \( R'_n(b, \omega) \) are specific functions, depending upon \( b \) and \( \omega \) and \( r_n^2, (n = 1, 2) \) are roots of the equation:

\[
(D^4 - GD^2 + L)\nu_1^e(x) = 0.
\]

And solutions of physical quantities are given by:

\[
u_2^e(x) = \sum_{n=1}^{2} [L_{1n} R_n(b, \omega) e^{r_n x}],
\]

\[
\sigma_{xx}^e(x) = \sum_{n=1}^{2} [L_{2n} R_n(b, \omega) e^{r_n x}],
\]

\[
\sigma_{yy}^e(x) = \sum_{n=1}^{2} [L_{3n} R_n(b, \omega) e^{r_n x}],
\]

\[
\sigma_{xy}^e(x) = \sum_{n=1}^{2} [L_{4n} R_n(b, \omega) e^{r_n x}],
\]

where, the coefficients \( G \), \( L \) and \( L_{kj} \) are given in Appendix 5.
4. Applications

We suppress the positive exponentials in the physical problem to determine the parameters $M_n$, $(n = 1, 2, 3, 4)$ and $R_n$, $(n = 1, 2)$, which are unbounded at infinity. Constants $M_1, M_2, M_3, M_4$ and $R_1, R_2$ have to be selected, such that boundary conditions at the surface $x = 0$ are:

\[
\sigma_{xx} = \sigma_{xx}^e - P_1 e^{\omega t + i by}, \quad u_1 = u_1^e, \quad u_2 = u_2^e, \quad \sigma_{xy} = \sigma_{xy}^e, \quad \varphi = 0, \quad \frac{\partial T}{\partial x} = 0.
\]

where $P_1$ is the magnitude of the mechanical force.

Using the expressions of $\sigma_{xx}$, $\sigma_{xx}^e$, $u_1$, $u_1^e$, $u_2$, $u_2^e$, $\sigma_{xy}$, $\sigma_{xy}^e$, $T$, $\varphi$ into above boundary conditions, we get:

\[
\begin{align*}
&\sum_{n=1}^{4} [H_{4n}M_n] - 2 \sum_{n=1}^{2} [L_{2n}R_n] = -P_1 - S_4, \\
&\sum_{n=1}^{4} [M_n] - 2 \sum_{n=1}^{2} [R_n] = -S, \\
&\sum_{n=1}^{4} [H_{1n}M_n] - 2 \sum_{n=1}^{2} [L_{1n}R_n] = -S_1, \\
&\sum_{n=1}^{4} [H_{5n}M_n] - 2 \sum_{n=1}^{2} [L_{4n}R_n] = -S_5, \\
&\sum_{n=1}^{4} [H_{3n}M_n] = S_3, \\
&\sum_{n=1}^{4} [H_{2n}k_nM_n] = 0.
\end{align*}
\]

After solving the above system of non homogeneous equations, we get the values of constant $M_1, M_2, M_3, M_4, R_1, R_2$ and hence, obtain the components of normal displacement, normal force stress, temperature distribution and microelongation at the interface of microelongated thermoelastic half space and elastic half space.

**Special Cases**

1. If we neglect microelongation effect i.e. $\lambda_0 = \beta_1 = \lambda_1 = a_0 = j_0 = 0$, we obtain the results for thermoelastic solid (TS).

2. Letting $Q \to 0$ in (7) and $\mu^e \to 0$ in (8) and (9), problem reduces to a plane strain problem in thermoelastic microelongated solid with an overlying infinite non viscous fluid [34].

5. Numerical results and discussions

For numerical computations, we consider the values of constants for aluminium epoxy-like material as [28]:

\[
\lambda = 7.59 \times 10^{10} \text{ N/m}^2, \quad \mu = 1.89 \times 10^{10} \text{ N/m}^2, \quad a_0 = 0.61 \times 10^{-10} \text{ N},
\]
\( \rho = 2.19 \times 10^3 \text{ kg/m}^3 \), \( \beta_1 = 0.05 \times 10^5 \text{ N/m}^2\text{K}, \ \beta_0 = 0.05 \times 10^5 \text{ N/m}^2\text{K}, \)
\( C^* = 966 \text{ J/(kgK)}, \ \ K^* = 252 \text{ J/msK}, \ \ j_0 = 0.196 \times 10^{-4} \text{ m}^2, \)
\( \lambda_0 = \lambda_1 = 0.37 \times 10^{10} \text{ N/m}^2, \ t_0 = 0.01, \ \ t_1 = 0.0001, \ \ T_0 = 293 \text{ K}. \)

The physical constants for elastic medium (granite) as [33]:
\( \lambda^e = 0.884 \times 10^{10} \text{ N/m}^2, \ \mu^e = 1.2667 \times 10^{10} \text{ N/m}^2, \ \rho^e = 2.6 \times 10^3 \text{ Kg/m}^3. \)

The computations are carried out for the value of non-dimensional time \( t = 0.2 \) in the range of \( 0 \leq y \leq 10 \) and on the surface \( x = 1.0 \). The numerical values for normal displacement, normal force stress, temperature distribution and microelongation are shown in Figs 2–5 for Green Lindsay (GL) theory \( \delta_{1k} = 0, \ \delta_{2k} = 1 \) and mechanical force with magnitude: \( P_1 = 1.0, \ \omega = \omega_0 + i\xi, \ \omega_0 = -0.2, \ \xi = 0.1 \) and \( b = 0.8 \).

(a) Thermoelastic microelongated solid (TMS) with \( Q = 1.0 \) by solid line with dashed symbol ♦.

(b) Thermoelastic microelongated solid (TMS) with \( Q = 10.0 \) by dashed line with centered symbol ■.

(c) Thermoelastic solid (TS) with \( Q = 1.0 \) by dashed line with centered symbol ▲.

(d) Thermoelastic solid (TS) with \( Q = 10.0 \) by dotted line with centered symbol ×.
6. Discussion

As expected, the values of normal displacement, normal force stress, temperature distribution, and microelongation near the point of application of source are bigger, when the magnitude of internal heat source is larger.
(\(Q = 10.0\)) as compared to that, when the magnitude of internal heat source is \((Q = 1.0)\) in the range of \(0 \leq y \leq 10.0\). From the Figs 2 and 3, it is very much clear that normal displacement and normal force stress vary in similar manner. The variation of all the quantities tends to zero as horizontal distance increases. These variations of normal displacement, temperature distribution, normal force stress and microelongation are shown in Figs 2–5, respectively.

7. Conclusion

1. Microelongation and internal heat source have appreciable effect on all quantities.

2. The magnitude of quantities in the neighbourhood of mechanical force increases with increase in magnitude of internal heat source.

3. The problem may also be discussed in context of mechanical force (i.e. \(Q \to 0\)) and internal heat source (i.e. \(P_1 \to 0\)), separately. The graphical results of these expressions may also be discussed in similar way.

4. The problem finds wide applications in dynamics and thermoelastic theory, including solid-liquid crystals, composite reinforced materials and porous media.
